Understanding Document

The project is about developing a Registration Form for job application. In this project, user can fill Log-In Details, Personal Details, Educational Qualification and Professional Details. Also user can submit and reset the form.

Technical Details:

This project is being developed in ASP.NET Core Web App(MVC), Entity Framework and SQL Server as database backend. Bootstrap template is used for UI purposes.

Functional Description:

Registration Module: This module allows the user to fill the required details. Also user can submit and reset the details.

Page Description:

There will be a single page which contains four section:

Section 1:

LogIn Details: This section contains required login details i.e. Email, Name, Password etc.

Section 2:

Personal Details: This section will contain personal details of a user(phone number, date of birth, city etc.). This section also contains dropdown list for Gender, Marital Status, Country, State, City and Locality.

Section 3:

Education Details: This section will contain qualification details of a user(Highest qualification held, Specialization & Institute etc.). There is a please specify field in this section where user can fill institute name if institute name is not present in the dropdown list.

Section 4:

Professional Details: This section will contain all the professional details of a user i.e. Total Experience, Job Category etc. This section also contains File upload field where user can upload resume.

All sections contains some required fields & dropdown list. Also, user can submit and reset the form using submit & reset button.

My Role:

- Development, coding, debugging, writing test cases as per the requirement

- Designing Database Schema
